HIGH PERFORMANCE FLOOR COATINGS

BGP's staff is trained and certified to install Dur-A-Flex Systems and Rock Solid Floors, two of the best coatings manufacturers in the business.

Our diamond floor grinding preparation is one of the best processes in the floor coatings industry. In order for your new floor coating system to work properly, it is essential that you grind off the existing damaged flooring and other contaminants present on your slab. This includes chipped epoxy or painted floors and oil or other chemical contaminants that have built up over time. These contaminants block the new coating from making a clean bond with your concrete slab. When dealing with floor coating systems, we have found that preparation of the floor prior to coating is the key to a long lasting, durable floor.

There are many different applications for High Performance Floor Coatings. Please contact us with your specific needs:

- For use in: Manufacturing, Auto Service, Food Service, Medical Labs, Clean Rooms, Retail, Schools, Distribution Centers, Warehouses, Grocery, Residential Basements or Garages, and others
- Chemical, Abrasion and Temperature resistant coatings
- Polyaspartic Polyurea-decorative industrial coating dries in 6 hours-ready for vehicle traffic
- Decorative Coatings include: Concrete Acid Stains, Concrete Dyes, Solid color stains, Decorative Chip and Quartz blends, and Concrete Pattern Stamping
- Clear Coat Sealers: Urethanes, Epoxies, Water and Solvent based sealers

In addition to improving the efficiency of your site to be cleaned and maintained, High Performance Coatings will enhance your public image and also improve your employee's work environment. The coating can improve light reflectivity in the room as well as improve traction. Your floor is generally more flat as a result of our diamond grinding preparation and seamless floors make it easier to roll equipment or merchandise across your floor.

- Polished Concrete Slabs
- Chemical/Abrasion Resistant Floors
- Seamless Floor Coatings
